• Novella SatComs reserves the right to modify or amend the present specification without prior notice. While best efforts were used to ensure feasibility and adherence to spec figures, adjustments may be required.

(1) Measured at maximum gain.

⁽²⁾ Gain and frequency dependant measurements must be performed using a calibrated scalar (or vector) analyser, minimum standard Agilent model 8757D. All cables must be calibrated and their losses taken into account. Failure to adhere to these industry standard practices will render measurements invalid. No claims under warranty for "Out of Spec" items will be accepted by Novella SatComs unless such procedures are rigorously adhered to.

(3) Ripple spec measurement does not include 300MHz segment below the lowest limit and above the highest.

(4) At maximum gain.

- (b) Other IF's and bandwidths possible.

NOTE

All Novella's frequency converter synthesisers are of the conventional phase-locked type. No DDS techniques or ICs are used. DDS synthesisers suffer from an inherent phase uncertainty (due to the inevitable residual frequency error) rendering them unsuitable for differential phase measurements used typically in satellite ranging and monopulse tracking systems which rely on differential phase measurements between two coherent signals processed by two downlink chains.
